LIBRARY SERVICES FOR CIHR PROGRAM

Library Services for CIHR Program in Circumpolar Chronic Disease Prevention

The following is a summary of the services the Neil John Maclean Health Sciences Library provides in support of the research program during the period of the CIHR grant, April 1, 2006 to March 31, 2011. Please contact us directly if you have any questions or suggestions for additional services.

Please visit this page often as we will be adding more resources and information about services on a regular basis.

Janice Linton

Aboriginal Health Librarian
janice_linton@umanitoba.ca

The Principle Investigators responsible for collaborating with the team and delivering library services from the University of Manitoba are Janice Linton, Aboriginal Health Librarian, and Ada Ducas, Head, University of Manitoba Health Sciences Libraries and Assistant Professor, Faculty of Medicine.

Arnaert, A., & Schaack, G. (2006). Cultural awareness of Inuit patients' experiences with emergency nursing care. *Accident and Emergency Nursing, 14*(2), 97-103.

Around 1500 Inuit patients fly annually from Nunavut to hospital centres in Montreal. This is a tense experience for many Inuit, due to cultural differences, and task-driven nursing practices often inadequately meeting their holistic health beliefs. In this qualitative study, we explored the experiences of Inuit patients with emergency nursing (EN) in the McGill University Health Centre, to inform on the best holistic nursing practices to meet culturally specific needs. Data analysis from semi-structured interviews with four participants generated a single theme: "rationalizing the care". While staying in the emergency department (ED), Inuit patients progressed through three steps in this rationalization process: first impressions of EN, perceiving the realities of EN, and appreciating EN care. "Being away from home" emerged as a stressor, and "other Inuit support", acted as a mediator. The participants in this study felt they had been shown culturally sensitive treatment through being kept informed, and skills of the nurses. As instruments of healing, therefore, the nurses in this study were able to apply a holistic approach to provide culturally sensitive care. Participants also highlighted speaking the same language and having direct access to an interpreter as key to improving ED experiences.

Chan, H. M., Fediuk, K., Hamilton, S., Rostas, L., Caughey, A., Kuhnlein, H., et al. (2006). Food security in Nunavut, Canada: Barriers and recommendations. *International journal of circumpolar health, 65*(5), 416-431.

OBJECTIVES: The food supply of Inuit living in Nunavut, Canada, is characterized by market food of relatively low nutritional value and nutrient-dense traditional food. The objective of this study is to assess community perceptions about the availability and accessibility of traditional and market foods in Nunavut. **STUDY DESIGN:** A qualitative study using focus group methodology. **METHODS:** Focus groups were conducted in 6 communities in Nunavut in 2004 and collected information was analyzed. **RESULTS:** Barriers to increased traditional food consumption included high costs of hunting and changes in lifestyle and cultural practices. Participants suggested that food security could be gained through increased economic support for local community hunts, freezers and education programs, as well as better access to cheaper and higher quality market food. **CONCLUSIONS:** Interventions to improve the dietary quality of Nunavut residents are discussed.
